Surgical masks and oxygen therapy

Evidence check question

What is the evidence for wearing a surgical mask at the same time as an oxygen mask?

a) What does this do to the percentage of supplemental oxygen that is delivered to the patient?

b) Should the oxygen mask be worn over the top of the surgical mask, or underneath it?

In brief

- In vitro and clinical studies have demonstrated that placing a surgical mask on patients significantly reduces dispersion distance and levels of virus-infected bio-aerosol 20cm away from patients while coughing.(1, 2)
- To mitigate the risk of spread of disease, a nasal cannula can be placed and covered with a surgical mask to limit the potential for environmental contamination.(3)
- Evidence on the percentage of supplemental oxygen that is delivered to the patient when wearing both a surgical mask and oxygen mask in the context of COVID-19 is lacking. A short report tested breathing air wearing a surgical mask on the face; second, breathing 6 l.min$^{-1}$ oxygen via a Hudson mask placed over the top of a surgical mask; and third, breathing 6 l.min$^{-1}$ oxygen via a Hudson mask placed underneath a surgical mask, where the $F_{O_2}$ measured was 0.20, 0.50 and 0.54, respectively.(4)
- Evidence on whether an oxygen mask can be worn over the top of a surgical mask, or underneath it includes:
  - A joint international consensus document recommends keeping a simple surgical face mask on patient, over nasal prongs and under any type of oxygen face mask.(5)
  - A short report calls for a surgical mask to be placed over the patient’s nose and mouth immediately following extubation, and for a Hudson mask to be placed on top due to the negligible difference in $F_{O_2}$ when the Hudson mask is placed over a surgical mask.(4)
  - Chinese consensus guidelines also describe that the surgical or N95 mask is applied under the oxygen mask.(6)
  - While some consensus guidelines recommend placement of a surgical mask over patients being treated with high flow therapies.(2)
Limitations
Evidence on this topic is emerging and many of the studies included in this review are of low quality or consensus based.

Background
Many experts have patients who wear nasal cannula also wear a droplet mask, especially during transport or when staff are in the room. Data to support this practice are largely non-peer-reviewed or derived from simulation experiments predating COVID-19.(7-9)

Covering the nose and mouth with a face mask of individuals symptomatic with COVID-19 has been recommended by several organisations including in Australia. Recent consensus guidelines published in *Anaesthesia* recommend that patients wear a face mask in addition to their oxygen mask or nasal cannula following tracheal extubation, where this is practicable.(4)

| Oxygen: under or over a surgical facemask for COVID-19 patients?  
Binks, et al. 2020 (4) | • Using a carbon dioxide sample line attached to a 16G cannula, authors measured the FIO2 at the lips in a healthy volunteer in three situations. The first, breathing air wearing a surgical mask on the face; second, breathing 6 l.min⁻¹ oxygen via a Hudson mask placed over the top of a surgical mask; and third, breathing 6 l.min⁻¹ oxygen via a Hudson mask placed underneath a surgical mask.  
• The FIO2 measured was 0.20, 0.50 and 0.54, respectively.  
• Given the negligible difference in FIO2 when the Hudson mask is placed over a surgical mask, our COVID-19 extubation protocols now call for a surgical mask to be placed over the patient’s nose and mouth immediately following extubation, and for a Hudson mask to be placed on top. |
| Minimising droplet and virus spread during and after tracheal extubation  
Kristensen, et al. 2020 (10) | • Surgical face masks reduce respiratory virus shedding in respiratory droplets and aerosols of symptomatic individuals.  
• Applying a surgical mask to the patient’s face before removing the tracheal tube, and leaving the mask on the patient during transport, post-anaesthesia recovery room stay, and on the ward. |
| Low-flow nasal cannula oxygen and potential nosocomial spread of COVID-19  
Goldhaber-Fiebert, et al. 2020 (3) | • Some institutions have begun covering low-flow nasal cannulae in certain contexts, although discussions with peers across specialities and institutions suggest that the practice is far from uniform and is sometimes limited to known COVID-19 patients.  
• When low-flow oxygen via nasal cannula is clearly indicated, simple strategies can be used to mitigate the risk of spread. For example, before extubation, a nasal cannula can be placed and covered with a surgical mask to limit the potential for environmental contamination.  
• Local conditions and supplies should guide considerations of using surgical masks to cover all low-flow nasal cannulae. If surgical masks are in short supply, other coverings, including cloth masks, might be of use. |

| **Respiratory support for adult patients with COVID-19**               | • Narrative review.  
• Some guidelines recommend placement of a surgical mask over patients being treated with high flow therapies as a secondary safety measure.  
• High fidelity human mannequin simulation studies show surgical masks do, in fact, reduce exhaled air dispersion. |
| Whittle, et al. 2020 (2)                                              |                                                                                                                                                                                                     |
| **High-flow nasal cannula for COVID-19 patients: low risk of bio-aerosol dispersion** | • Letter.  
• In vitro and clinical studies have demonstrated that placing a simple surgical protection mask on patients significantly reduces dispersion distance and levels of virus-infected bio-aerosol 20cm away from patients while coughing.  
• Such a surgical mask can be worn by a patient oxygenated through a nasal cannula (standard nasal cannula or high-flow nasal cannula) but not when using simple, non-rebreathing or Venturi oxygen masks.  
• Taken together, compared to oxygen therapy with a mask, the utilisation of high-flow nasal cannula does not increase either dispersion or microbiological contamination into the environment.  
• The patient being able to wear a surgical mask on top of high-flow nasal cannula, in order to reduce the aerosol transmission during coughing or sneezing, represents an additional benefit. |
| Li, et al. 2020 (1)                                                   |                                                                                                                                                                                                     |
| **Just the Facts: Airway management during the coronavirus disease 2019 (COVID-19) pandemic** | • Case report.  
• On arrival at the emergency department (ED), the patient’s heart rate was 130 beats/min, respiratory rate 32 per/min, and oxygenation saturation 82% on room air.  
• As per emergency medical services (EMS) protocol, they placed him on nasal prongs under a surgical mask at 5 L/min and his oxygen saturation improved to 86%. |

Grey literature

Safe use of oxygen and ventilatory devices for adults and paediatrics during the COVID-19 outbreak
Government of Western Australia Department of Health (15)

Oxygen Therapy with Limited Resources
Joint document: Australian and New Zealand College Of Anaesthetists, Australian college for emergency medicine, Pacific Community and World Federation of Societies of Anaesthesiologists (5)

- Keep a simple surgical face mask on patients, over nasal prongs and under any type of oxygen face mask. This reduces viral spread to staff and other patients.
- Caution: aerosolised droplet spread with high flow O2 from all devices. Keep simple surgical face mask over prongs or under oxygen mask at all times. Humidification should never be used: viral spread and equipment may be contaminated.

Coronavirus disease 2019 (COVID-19): Critical care and airway management issues
Anesi, 2020

- Many experts have patients who wear a nasal cannula and a droplet mask, especially during transport or when staff are in the room.
- Data to support this practice are largely non-peer-reviewed or derived from simulation experiments.

Rapid evidence checks are based on a simplified review method and may not be entirely exhaustive, but aim to provide a balanced assessment of what is already known about a specific problem or issue. This brief has not been peer-reviewed and should not be a substitute for individual clinical judgement, nor is it an endorsed position of NSW Health.
