

## Evidence check

7 December 2020

Rapid evidence checks are based on a simplified review method and may not be entirely exhaustive, but aim to provide a balanced assessment of what is already known about a specific problem or issue. This brief has not been peer-reviewed and should not be a substitute for individual clinical judgement, nor is it an endorsed position of NSW Health.

## Routine border screening

### Evidence check question

1. What is the evidence or existing policy for routine asymptomatic screening for COVID-19 in exposed workers at border settings (such as airports, seaports, hotel quarantine)?
  - a. Is there evidence for which workers should be screened (such as all staff, cleaning staff, compliance staff, security, catering, health)?
  - b. What is the most effective frequency of screening?
  - c. What is the most effective type of screening (such as saliva, nasopharyngeal swabs, serology)?

### In brief

#### Peer reviewed literature

- No studies were identified in the peer reviewed literature for routine asymptomatic screening for COVID-19 in exposed workers at border settings. Many articles on asymptomatic screening for travellers were identified, but not included in this review.

#### Grey literature and news

- Many documents outline action plans, including monitoring and reporting of COVID-19 symptoms of workers and encouraging testing if workers have symptoms, without mentioning routine testing.
- In Australia, hotel quarantine has been identified as a major risk for the reintroduction of COVID-19 to Australia and as a result, state health authorities have introduced weekly testing of quarantine staff.
- Asymptomatic workers at Western Australia's borders and in quarantine hotels will be able to take up weekly COVID-19 testing (from 11 September until 30 November). This includes testing staff at:
  - quarantine hotels including; hotel employees, security staff working at the hotel, health staff, drivers of transport of quarantine guests, WA police and others such as the defence force
  - Perth airport including; workers on site, airport or airline staff, WA police, security, federal agencies, drivers of hotel quarantine buses

- sea ports and border crossings including; anyone involved with close contact of people arriving from overseas or interstate.
- In New Zealand, an asymptomatic testing program for higher-risk workers includes:
  - managed quarantine facilities and transport (testing once every 7 days)
  - managed isolation facilities and transport (testing once every 14 days)
  - Ports of Auckland, Port of Tauranga and Auckland International Airport (testing once every 14 days)
  - people who work in managed isolation or quarantine facilities, including those who drive people entering the country from the airport to the facilities, border workers in customs, biosecurity, immigration and aviation security at airports, people who clean in areas used by arriving travellers, or who clean the aircraft, and people working in airside services such as food-halls where people in transit may be waiting. Border workers at maritime ports such as ship pilots, stevedores and those providing seafarer welfare support as well as people working in customs, immigration and public health at maritime ports and air crew.
- In Singapore, staff at Changi Airport who come into close contact with passengers are tested for COVID-19 every two weeks.
- The United States
  - Department of Transportation have guidance for air carriers and staff based around health monitoring and screening for symptoms at the start of duty
  - Delta airlines announced it will start offering rapid response COVID-19 tests to its flight attendants. The optional tests will be performed by a clinician via nasal swab with results taking fewer than 15 minutes (news article)
  - In high-density critical infrastructure workplaces, the Centers for Disease Control and Prevention recommend a risk-based approach to testing co-workers of a person with confirmed COVID-19. General practices should include pre-screening (temperature and symptom assessment) and regular monitoring of symptoms.

## Limitations

Guidance on border screening should be interpreted in the context of disease prevalence and this information is rarely provided by the included publications. This review includes international publications from grey literature, where targeted searches were done on specific countries, but this may not be complete. Articles included in this review vary in type and quality, and due to a lack of relevant findings, low level evidence and news articles have been included. The evidence behind how these decisions are made is not generally described in the publications and articles.

## Background

In Australia, following a second outbreak of COVID-19 linked to overseas travellers in supervised isolation, staff working at quarantine hotels and other facilities will be subject to mandatory weekly COVID-19 tests as reported by [ABC news](#).

The United States Department of Labor provided examples of border protection and transportation security work tasks associated with exposure risk levels.

- Lower: administrative duties and routine border security in non-public areas of work sites

- Medium: routine border security activities and transportation security screening activities at passenger check points
- High: entering rooms where travellers with suspected COVID-19 have been isolated or physical contact with travellers with suspected COVID-19
- Very high: not applicable for most anticipated tasks.

Centers for Disease Control and Prevention in the United States have guidance for border health which focuses on testing travellers rather than workers. General principles include:

- adjusting screening processes according to current local needs
- considerations for capacities needed to implement including legal and regulatory authority, funding, housing, healthcare and communication.

Screening travellers for COVID-19 at border entries is well described through the grey literature. Temperature screening alone, at exit or entry, is not an effective way to stop international spread, as infected individuals may be in incubation period as it may not express apparent symptoms early in the course of the disease.(1)

## Methods (Appendix 1)

PubMed and grey literature were searched on the 19 November 2020. For grey literature searches, targeted searches for individual countries were carried out. Targeted countries searched included Germany, Hong Kong, Japan, New Zealand, Norway, Singapore, South Korea, Spain, the United Kingdom (2), Australia and the United States. Some articles not on routine testing but on information for border workers were also included in Table 2.

Table 1: Grey literature routine testing

<p><a href="#">Testing Strategy for Coronavirus (COVID-19) in High-Density Critical Infrastructure Workplaces after a COVID-19 Case Is Identified</a></p> <p>Centers for Disease Control and Prevention</p> <p>October 21 2020</p>	<ul style="list-style-type: none"> <li>• This document presents different testing strategy options for exposed co-workers when public health organisations and employers determine testing is needed to help support existing disease control measures.</li> <li>• After a COVID-19 case is identified, testing strategies of exposed co-workers may be considered to help prevent disease spread, to identify the scope and magnitude of SARS-CoV-2 infection, and to inform additional prevention and control efforts that might be needed.</li> <li>• Viral (nucleic acid or antigen) testing should be used to diagnose acute infection.</li> <li>• Positive test results indicate the need for exclusion from work and isolation at home.</li> <li>• A risk-based approach to testing co-workers of a person with confirmed COVID-19 may be applied. Such an approach should take into consideration the likelihood of exposure, which is affected by the characteristics of the workplace and the results of contact investigations.</li> <li>• Tier 1 is the highest priority for testing of exposed co-workers. This includes close contacts and co-workers who work during the same shift or overlapping shifts, in the same area, for example on the same line and same room, as one or more of the workers with COVID-19, based on the employer's assessment of risk in the workplace, such as the layout and size of the room.</li> <li>• Tier 2 is the next highest priority tier for testing. Tier 2 includes workers on the same shift, but in a different area of the facility or operation who may have had an exposure to a worker with confirmed COVID-19.</li> <li>• Tier 1 and Tier 2 testing. This would include testing all exposed workers on the same shift as the worker(s) with confirmed COVID-19, regardless of area of the facility.</li> <li>• Tier 3 includes workers who shared a common space (e.g. a rest room, break room) and therefore exposure to worker(s) with confirmed COVID-19 cannot be definitively ruled out. Testing may be extended to workers in Tier 3 based on contact tracing or on the employer's concern about overall risk of COVID-19 in the workplace.</li> </ul>
<p><a href="#">Implementing Safety Practices for Critical Infrastructure Workers</a></p>	<ul style="list-style-type: none"> <li>• Critical Infrastructure workers who have had an exposure but remain asymptomatic should adhere to the following practices prior to and during their work shift.</li> </ul>
